

Waterfall Development is a type of development that allows developers to work step by step in order to complete a program or software. It works like a waterfall, working on and completing each step before moving onto the next. Agile development works on multiple parts of a program and completes them all before each of the parts are put together at the end. This type of development is usually done in large groups and is done much faster than the standard Waterfall Development. Planning the development of a product or program are done much faster than that of Waterfall development making it a bit less reliable.
